480L Digital Effects System

Classic Cart Programs

This manual contains complete information on the 480L Classic Cart programs, a collection of four algorithms and 40 supporting programs which bring the essence of the 224XL to the 480L. The four algorithms are: Concert Hall, Rich Plate, 6-Voice Chorus, and a newly-developed 1/3 Octave Multiband Delay.

The Classic Cart contains a wide variety of programs which can be used with many different signal sources. Many programs have names, such as Vocal Plate or Reggae Hall, which indicate the type of instrument or voice source and/or rhythm feel which might be appropriate.

Programs in the Classic Cart will run in any system configuration (single, mono split, stereo split, or cascade) in any machine (A, B, or both) in any 480L running Version 4 system software.

Concert Hall Parameters

The Concert Hall Program

The Concert Hall program consists of two parts; the reverberator and two 3-voice stereo pre-echo delay lines. The six independant pre-echoes are non-diffused. The reverberator has controls affecting both low frequency and mid frequency decay times. A gentle 6dB/octave crossover controls the frequency division. Reverb Treble Contour (RTC), adjusts high frequency damping within the reverberator. Another high frequency filter, High Frequency Cut (HFC) is functionally located at the output of the entire program. Setting HFC to some high value will pass the pre-echoes through a higher bandpass; if RTC is is set to some low value, the reverb content will be filtered lower as the reverb tail fades away. Think of RTC as high frequency room absorption. The Size parameter (SIZ) controls overall reverb density. Medium to large hall emulation should have size values of 28 or higher.

About the Concert Hall Parameters

Page One

RTL (Low-Frequency Reverb Time)

RTL sets the reverb time for low-frequency signals, as a multiplier of the RTM parameter. For example, if RTL is set to 2X, and RTM is set to two seconds, the low frequency reverb time will be four seconds. For a natural-sounding hall ambience, we recommend values of 1.5X or less.

RTM (Mid-Frequency Reverb Time)

RT MID sets the reverb time for mid-frequency signals *when the signal stops*. Because low-frequency reverb time (RTL) is a multiplier of RTM, RTM acts as a master control for the stopped reverb time. The actual value set for RTM varies with the setting of SIZ. SIZ should be adjusted before RTM.

XOV (Crossover)

XOV sets the frequency at which the transition from RTL to RTM takes place. XOV should be set at least two octaves higher than the low frequency you want to boost. For example, to boost a signal at 100 Hz, set XOV to 400 Hz (This setting works well for classical music). XOV works best around 500 for boosting low frequencies, and around 1.5 kHz for cutting low frequencies.

RTC (Reverb Time High Frequency Cutoff)

RTC sets the frequency above which sounds decay at a progressively faster rate. It filters all the sound except the preechoes. When set relatively low, it gives a darker tone to the reverberation, simulating the effect of air absorption in a real hall. This also helps keep the ambience generated by the program from muddying the direct sound.

DEP (Depth)

DEP positions the listener relative to the sound source. When DEP is low, reverb attack is fast and strong. Increasing DEP moves the listener position toward the rear of the hall.

PDLY (Predelay)

PDLY sets the amount of time which elapses between input of signal and the onset of reverberation. Under natural conditions, the amount of predelay depends on the size and construction of the acoustic space and the relative position of the sound source and the listener(s). PDLY attempts to duplicate this phenomenon and is used to create a sense of distance and volume within an acoustic space. Relatively long PDLY settings place the reverberant field behind rather than on top of the input material. Extremely long PDLY settings produce unnatural sounds that often prove interesting.

A sense of continuity between source and reverb is maintained up to around 40 ms of predelay, after which the sound begins to separate into distinct patterns; however, large values of PDLY can effectively give the impression of large size if early reflections are used to fill in the spaces between input and the delayed reverberation.

Page Two

CHO (Chorus)

CHO randomly pitch shifts the reverb output. This helps reduce long live nodes and coloration. High amounts of CHO will sound very unatural, but could be interesting if the reverb time is kept short.

HFC (High Frequency Cutoff)

HFC sets the frequency above which a 6 dB/octave low-pass filter attenuates the processed signal. It attenuates both preechoes and reverberant sound. High frequencies are often rolled off with this parameter, resulting in more natural sounding reverberation.

DIF (Diffusion)

DIF affects the initial early reflection density of the reverb. It does not affect the pre-echoes. Realistic sounding halls have a moderate amount diffusion.

DEF (Definition)

DEF controls the articulation of the reverb delay loops. Low amounts of definition and depth will produce a "wavy" reverb effect.

SIZ (Size)

SIZ sets the rate of buildup of diffusion after the initial period (which is controlled by DIF). Generally, you should set SIZ to approximate the size of the acoustic space you are trying to create. The size in meters is roughly equal to the longest dimension of the space. Moving SIZ while a signal is present momentarily mutes the reverb signal.

MIX (Wet/Dry Mix)

MIX controls the ratio of direct vs. effect signal in the output from a program. When the 480L is patched into a console, this control should almost always be set to 100% wet. When an instrument is plugged directly into a 480L, or when the Cascade configuration is in use, a setting between 45 and 60% is a good starting point for experimentation with this parameter.

MIX is a sine/cosine fade. Practically speaking, this means that MIX can be adjusted over its range with little or no change in output level. When you control mix at the console, adding effect to the dry signal increases overall level.

Page Three

The six pre-echoes allow the construction of discrete echoes simulating stage reflections. Typical classical recording should be free of pre-echoes; pop recordings may be different. There are separate controls for Level and Delay of the pre-echoes, labeled LV and DL, respectively.

LV 1-6 (Pre-Echo Levels)

Preechoes can best be understood by visualizing a stage where the early reflections are the sounds emanating from the rear and side stage walls directly after the sound from the stage. Usually the rear stage wall reflection is earlier and louder than those from the two side walls.

The preecho reflection parameters change the perceived locations of reflecting surfaces surrounding the source. The pre-echo level controls adjust the loudness of the reflection.

Page Four

DL 1-6 (Pre-Echo Delays)

For each of the LV parameters, there is a corresponding DL parameter. Each sets the delay time in ms for one of the preechoes. Pre-echo delays are not affected by PDLY, so pre-echoes can be placed to occur before reverberation starts.

1 Concert Hall

This preset combines all the original algorithm elements of the 224 Concert Hall. The size is set large with the depth set halfway back in the hall. If more immediate reverb impact is needed set the depth control to 10 or less. The reverb tail is set to match the Room size. Changing room size will vary the reverb time automatically.

2 Medium Hall

This preset takes all the elements of Large Hall and brings them a bit closer in. A good starting point for strings and BG vocals.

3 Small Hall

Smaller still. Adds a nice "envelope" around an acoustic piano track.

4 Gold Hall

Combines more bass and treble response as well as a "deeper" position in the hall. Two pairs of pre-echoes liven up the sound. The chorusing parameter is set a bit higher. Ballad type "pop" vocals work well here.

5 Guitar Hall

Any guitar, any time. Stronger bass and brighter than Gold Hall, but a smaller size and shorter reverb time. Two pre-echoes simulate wall reflections.

6 Reggae Hall

More of everything. Lots of undulation and chorusing to the reverb tail.

7 Reflex Hall

Quite an unnatural space. A bit tubby and deep with a short reverb tail. Two strong pre-echoes create the hard reflections. This preset was originally made with BG vocals although we suggest trying it with short staccato sounds. Adjust pre-delay to match the tempo.

8 Bright Hall

Very similar to Concert Hall except considerably brighter. No pre-echoes.

9 Dark Hall

A dark version of Concert Hall with a longer reverb tail and a bit more chorusing.

0 Oliver's Well

A variant of Dark Hall with all 6 pre-echoes active. Big and rich sounding. Use to "deepen" any sound source... about 100 feet worth.

2

Bank 19: the Rich Plate Programs

In this chapter we'll discuss the classic Rich Plate programs created for the 480L.

The Rich Plate Program

The Rich Plate algorithm is designed to simulate metal plate reverberation devices popular in the 70's and 80's. Typically, plates are bright and highly diffused.

Plates are characteristically colored in their reverberation content. Six pre-echoes similar to those in the Concert Hall program can be utilized to create hard non-diffused reflections. Note, however, that Echo Level 3 gets its feed from the right input, and Echo Level 4 gets its feed from the left.

Low frequency and mid frequency reverb times are independently adjustable with a cross-over control. Size controls reverb density. Since plates characteristically have high density, most realistic size settings should be between 19 and 28. Of course, other settings can be used for more extreme reverb effects.

About the Parameters

Page One

RTL (Low-Frequency Reverb Time)

RTL sets the low-frequency reverb multiplier.

RTM (Mid-Frequency Reverb Time)

RTM sets the mid frequency reverb time.

XOV (Crossover)

XOV set the crossover point between RTL and RTM.

RTC (Reverb Time Contour)

RTC adjusts the reverb time high frequency contour. This controls shortens the running reverb time above the selected frequency.

ATK (Reverb Attack)

ATK sets the explosivness of the reverb envelope. Lesser value settings have the sharpest attack.

PDLY (Predelay)

PDLY sets a delay line prior the reverberator.

Page Two

HFC (High Frequency Contour)

HFC sets the overall reverb and pre-echo frequency response.

DIF (Diffusion)

DIF sets the diffusion amount.

DCO (Decay Optimization)

DCO or decay optimization has two states: reverb and effects. In the Reverb mode, changing SIZ will change the reverb time as well. In the Effect mode, changing SIZ has no natural affect on the running reverb time.

SIZ (Size)

SIZ sets the initial reverb density.

MIX (Wet/Dry Mix)

MIX adjusts the ratio of Dry (unprocessed) digital audio with the Wet digital audio bus.

Page Three

LV 1-6 (Pre-Echo Levels)

LV1-LV6 adjust the level of the discrete pre-echoes. These pre-ecohes are not diffused.

Page Four

DL1-6 (Pre-Echo Delays)

DL1-DL6 adjust the delay of each pre-echo. Maximum value is 510 milliseconds

Lexicon

Program Descriptions

1 Large Plate

Standard sounding Rich Plate preset. The low-frequency Rt runs at a slightly shorter rate than the midfrequencies. This is a very diffuse preset with a moderate size. An excellent starting point to build other presets.

2 Drum Plate

A smaller size which sets a denser reverb tail. Some pre-echoes have been added to strengthen the initial sound source.

3 Vocal Plate

This version has a larger size with a softer attack. Slightly darker than a traditional plate, but great for making vocals cut through a mix. Adjust RTM to match the mood of the music.

4 Vox Plate #2

A bit duller and softer than Vocal Plate. All 6 preechoes are used giving a delay and reverb combination.

5 Slap Plate

Bright and thin. Good for dull sound sources or low resolution samples. Two pre-echoes are added for impact.

6 Guitar Plate

This is very dense and highly diffused preset. The inclusion of 4 pre-echoes, two of which are set near 150ms, make a very good enhancement to guitar tracks.

7 Short Plate

A very short plate which will create a very nice space around any track.

8 Horn Plate

Excellent for horn blatts and stabs. Very smooth, but also very dense. No pre-echoes, for a straight ahead reverb effect.

9 Echo Plate

Reverb plus long echoes. A little extra kick with a difference. If the echoes are a little too loud, go to page 3 and pull back the levels.

0 Silver Plate

A very large plate with lots of diffusion and brightness. The pre-echoes liven up the sound even more. Good on singular tracks.

3

Bank 20: the 6-Voice Chorus Programs

In this chapter we'll discuss the classic 6-Voice Chorus programs created for the 480L.

The 6-Voice Chorus Program

This program consists of two stereo delay lines, each with three delay taps. Each tap has adjustable level, delay, feedback, and pan. At the input of the delay lines there is a stereo all-pass diffusor, followed by a 6dB/ octave low-pass filter. Feedback paths are picked off pre-fader, retuning to the input before the rolloff filter, thus re-filtering each delay recirculation. Voice taps 3 and 4 are crossfed to opposite inputs.

The chorusing element, COR, controls the amount of randomization in each voice. Increasing COR increases both the rate and the depth of the randomization.

The DLY parameter is a master delay which adds a total offset to all six delay voices.

Lexicon

Program Descriptions

1 Woo-Woo

This preset is a very aggressive "flange" type of effect. Lots of movement with a moderate amount of diffusion. Just on the edge of howling feedback. This preset will continuously vary the timbre of any steady tone sound source. Push the master dly parameter to create echoes in rhythm with the track. Heavy, heavy effect for guitar solos.

2 6-Voice Korus

This baseline effect incorporates all 6 voices evenly panned across the stereo output. A high amount of diffusion "smears" the input signal. Great effect on vocals.

3 3-Voice Chorus

This preset is a 3 voice version of 6 voice. Voices 1 and 3 are panned hard left - right while voice 4 at nearly double the delay is panned up the middle. Diffusion set real high. A nice rolling effect on brass tracks if mixed under.

4 4-Voice Chorus

Less wobble and a bit more doubling with far less diffusion.

5 Ekoz & Korus

The first 3 voices panned left and 4 thru 6 panned right. Kind of a "combo" platter. Move the master dly to match tempo.

6 Vocal Chorus

4 voices of heavy, diffused chorusing. For BG vocals only.

7 Soft Echoes

This preset offers a gentle combination of diffused, filtered chorusing and soft distinct echoes. Lead vocal effect for female vox. Use master dly for tempo.

8 Hard Echoes

More aggressive. No diffusion with a higher chorusing value.

9 Canyon Korus

Chorused echoes coming from every direction. If monitored through surround decoder watch out!!!!!

0 Tuff Stuff

No delay, no diffusion, just strong chorusing all the time. Knock you in the face effect.

4

Bank 21: the Multi-Band Delay Programs

In this chapter we'll discuss the classic Multi-Band Delay programs created for the 480L.

The Multiband Delays Program

This program utilizes two stereo delay lines each 1478ms long (1354ms @ 48k). There are three voices per delay line. Each voice is band-pass tunable in 1/3 octave sections, starting at 50Hz, and continuing to 10kHz. Each voice additionally has control over level, delay, and pan.

Voices 1 and 4 have their own feedback path, with separate delay adjustments. Feedback paths are post-fader and post-EQ, returning to each left and right input respectively.

Program Descriptions

1 Closet

Full of clothes with the doors shut.

2 Telephone

Not up against your ear, but laid down on the nightstand. If you need more resonance go to page 5 and carefully add more feedback to voices 1 and 4.

3 Phartage

This one rips from left to right. Each voice gets progressively brighter in bandwidth. Each voice is spaced 20 milliseconds apart. Very strange.....

4 Stadium

Filtered Altec horns and reflections and echoes.

5 Downstairs

No furniture. Tubby and full of resonances. "Hey turn it off down there!!!!"

6 Bandsweep

Multiband and echoes. Panned left to right. Great for sharp sound effects. Go to page 5 feedbacks for additional repeats.

7 Bass Echoes

Dull echoes. Page 5 will adjust the feedbacks and delays feedbacks. This is kind of a distant and far away effect.

8 Band Bounce

Bright right, dull left. Back and forth...back and forth.

9 Whispers

Bright echoes all around.

0 On Stage

Like an empty stage with some drifting sound out into the hall. Really nice sounding on vocal tracks.

Lexicon, Inc. 3 Oak Park Bedford MA 01730-1441 USA Tel: 617-280-0300 Fax: 617- 280-0490
